## 2024\_28\_III\_OOPS Using Java Lab

### **REC\_2028\_OOPS using Java\_Week 10\_PAH**

Attempt : 1  
Total Mark : 30  
Marks Obtained : 30

#### **Section 1 : Coding**

##### **1. Problem Statement**

Sarah is working on a spam detection system that analyzes incoming messages for unique patterns. Spammers often use repetitive character sequences, making it important to identify the first non-repeating character in a message.

Given a string, Sarah needs to determine the first character that appears only once. If all characters repeat, the system should return -1.

She decides to use a HashMap to efficiently track character frequencies and find the solution.

##### ***Input Format***

The first line contains an integer N representing , the length of the string.

The second line contains a string of N lowercase English letters (a-z).

#### ***Output Format***

The output prints a character representing the first non-repeating character. If none exist, print -1.

Refer to the sample output for formatting specifications.

#### ***Sample Test Case***

Input: 10  
abacabadac  
Output: d

#### ***Answer***

```
import java.util.*;  
  
class Main {  
    public static void main(String[] args) {  
        Scanner scan = new Scanner(System.in);  
        int n = scan.nextInt();  
        scan.nextLine();  
        HashMap<Character, Integer> map = new LinkedHashMap<>();  
        String s = scan.nextLine();  
        for (int i = 0; i < n; i++) {  
            char x = s.charAt(i);  
            map.put(x, map.getOrDefault(x, 0) + 1);  
        }  
        int f = 0;  
        for (Map.Entry<Character, Integer> entry : map.entrySet()) {  
            if (entry.getValue() == 1) {  
                System.out.println(entry.getKey());  
                f = 1;  
                break;  
            }  
        }  
        if (f == 0) {  
            System.out.println(-1);  
        }  
    }  
}
```

```
}
```

Status : Correct

Marks : 10/10

## 2. Problem Statement

A university maintains a list of student records and wants to store them in a sorted manner based on their GPA. If two students have the same GPA, they should be further sorted by their name in lexicographical order. Implement a program that uses a TreeSet to store student records and ensures unique student IDs.

### ***Input Format***

The first line contains an integer N - the number of students.

The next N lines contain details of each student in the format: "StudentID Name GPA"

- StudentID (Integer) - A unique identifier.
- Name (String) - The student's name (can contain spaces).
- GPA (Double) - The Grade Point Average.

### ***Output Format***

The output prints the list of students in ascending order of GPA.

If two students have the same GPA, sort them by name.

Print details in the format: "StudentID Name GPA" in the output, GPA is rounded to two decimal places.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

```
Input: 5
101 John 8.5
102 Alice 9.1
```

```
103 Bob 8.5  
104 Zoe 7.3  
105 Charlie 9.1  
Output: 104 Zoe 7.30  
103 Bob 8.50  
101 John 8.50  
102 Alice 9.10  
105 Charlie 9.10
```

### Answer

```
import java.util.*;  
  
class Student implements Comparable<Student> {  
    int id;  
    String x;  
    double gpa;  
  
    Student(int id, String x, double gpa) {  
        this.id = id;  
        this.x = x;  
        this.gpa = gpa;  
    }  
  
    public int compareTo(Student other) {  
        if (Double.compare(this.gpa, other.gpa) != 0) {  
            return Double.compare(this.gpa, other.gpa);  
        } else if (!this.x.equals(other.x)) {  
            return this.x.compareTo(other.x);  
        } else {  
            return Integer.compare(this.id, other.id);  
        }  
    }  
  
    public String toString() {  
        String formatted = String.format("%.2f", gpa);  
        return id + " " + x + " " + formatted;  
    }  
}  
  
class Main {  
    public static void main(String[] args) {  
        Scanner scan = new Scanner(System.in);  
    }  
}
```

```

int n = scan.nextInt();
scan.nextLine();

TreeSet<Student> set = new TreeSet<>();
for (int i = 0; i < n; i++) {
    String s = scan.nextLine();
    String[] arr = s.split("\\s+");
    int id = Integer.parseInt(arr[0]);
    String x = arr[1];
    double gpa = Double.parseDouble(arr[2]);
    set.add(new Student(id, x, gpa));
}
}

Iterator<Student> it = set.iterator();
while (it.hasNext()) {
    System.out.println(it.next());
}
}
}

```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

Riya is building a calendar event scheduler where each event is stored in chronological order using a TreeMap. The key represents the event time in 24-hour format (HH:MM), and the value is the event description.

She wants the system to:

Automatically sort events by time. Avoid duplicate time entries – if a duplicate time is entered, ignore the new entry. Print all scheduled events in order.

Implement this logic using a class named EventManager.

#### ***Input Format***

The first line of the input contains an integer n, representing the number of events.

The next n lines each contain a string in the format: "HH:MM Description"

(Example: 09:00 TeamMeeting).

### ***Output Format***

The first line of the output prints "Scheduled Events:"

The next k lines print each event in the format: "HH:MM - Description"

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 5

09:00 TeamMeeting  
13:30 LunchBreak  
11:00 ProjectUpdate  
09:00 Standup  
15:00 ClientCall

Output: Scheduled Events:

09:00 - TeamMeeting  
11:00 - ProjectUpdate  
13:30 - LunchBreak  
15:00 - ClientCall

### ***Answer***

```
import java.util.*;  
  
class Main {  
    public static void main(String[] args) {  
        Scanner scan = new Scanner(System.in);  
        int n = scan.nextInt();  
        scan.nextLine();  
  
        TreeMap<String, String> map = new TreeMap<>();  
  
        for (int i = 0; i < n; i++) {  
            String s = scan.nextLine();  
            String[] arr = s.split("\\s+");  
  
            if (!map.containsKey(arr[0])) {
```

```
        map.put(arr[0], arr[1]);  
    }  
}  
  
System.out.println("Scheduled Events:");  
for (Map.Entry<String, String> entry : map.entrySet()) {  
    System.out.println(entry.getKey() + " - " + entry.getValue());  
}  
}  
}
```

**Status :** Correct
